Founded (year) 2022

foxbeam is a medtech startup developing a radiotherapy solution to treat cancer patients. The technology promises to deliver large radiation doses in a highly localized volume, thus effectively destroying tumor cells while sparing the surrounding, healthy tissue. This reduces the need to spread out the treatment over multiple sessions, effectively increasing the patient throughput of the treatment unit. Due to reduced technical complexity of the underlying technology, the devices are expected to be more affordable than state-of-the art linear accelerators.

Our vision is to give more patients access to optimal cancer therapy by helping clinics to treat the ever-increasing patient numbers with an effective and more economical treatment unit.
